### Name: Namrata Ruchandani NU ID: 002125637

### → Task done in this assignment:

- 1. In the find, I'm checking pathCompression first. If yes then I'm calling dopathCompression by passing root, and updating root as parent of root. If there is no pathCompression, I'm just pointing to the parent of root not grandparent. Finally, returning root.
- 2. In the mergeComponents, I'm comparing the height of two roots to be merged. Making root with larger size as parent of root with smaller size. If the sizes are similar, attach them and increase height by 1.
- 3. In the doPathCompression, I'm pointing to grandparent instead of parent, and thus doing pathCompression.
- 4. In the file name assignment3.java, I took input by using scanner command and then made an object uf of UF\_HWQUPC class. I stored the value of the number of components after each union in temp. I made a while loop with a condition when temp is not equal to 1, as when all components are connected, the number of components will be one. Generated p and q random numbers and then checked if connected or not. If not, I did union. Number of times random pairs are generated is counted by count. Hence, printing count as the number of pairs generated.

## → The screenshot of main method (or part 2 of assignment) assignment3.java code compilation and output

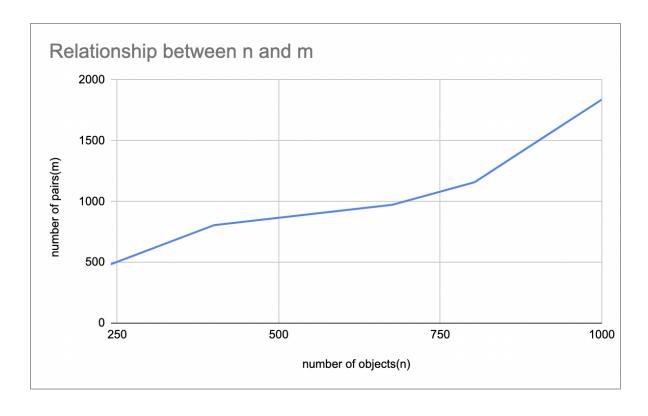

### → The link for file assignment3.java :

# → Conclusion about number of objects(n) and number of pairs(m) Ideally, there should be n-1 connections to make one component in the end. But, as we are generating random pairs then repeated cases can occur. This is justified after seeing

that the output of the number of pairs is more than n-1. The graph is linear showing the relation is  $\mathbf{n} + \mathbf{c}$ , where c is constant. I think, constant is added because of repeated pairs generated.

А	В
number of objects(n)	number of pairs (m)
240	484
400	806
676	973
803	1158
921	1566
1000	1838

→ I pushed the commands in the git and attached the link for the repository.

https://github.com/Namrata2108/INFO6205/tree/Fall2021/src/main/java/edu/neu/coe/info6205/union find

→ Below is the screenshot of successful test cases run
